(a) exact recovery vs the bound
logical infidelity $1 - F_e$
affected-location probability q
(b) bound conservatism
$F_e^{\text{exact}} - C_{7,1}(q)$
baseline only (log)
affected-location probability q
(c) sampled key dependence
key dependence of F_e^{exact}
measured comparison residual
(numerical reference)
affected-location probability q
$1 - C_{7,1}(q)$ (bound on the infidelity)
identity keys (density matrix)
non-Clifford keys (density matrix)
identity keys (Pauli enumeration)
reference noise point
baseline, identity
baseline, non-Clifford
strong XPM, identity
strong XPM, non-Clifford
baseline: 16 random key sets
baseline: fixed vs identity
strong XPM: 16 random key sets
strong XPM: fixed vs identity
